DeoDap SEO Tool

Functional Specification — Daily Automated SEO Audit & Recommendation Tool

Prepared for: DeoDap (deodap.in) **Document type:** Whole-and-sole tool functionality specification **Version:** 1.0 | **Status:** Ready for build/commissioning **Platform context:** Shopify-based wholesale e-commerce store (India), large product catalog, no-MOQ model, high category/collection page count

---

1. Purpose & Vision

DeoDap SEO Sentinel is an internal SEO auditing tool that runs **every day, automatically**, and answers three questions for the team without anyone having to ask:

1. **What broke or degraded on the site today?** (Technical, on-page, content, off-page, AEO/GEO)
2. **How serious is it?** (Critical / Medium / Low — with business impact attached)
3. **What exactly do we do about it?** (A customized, step-by-step fix per issue — not generic advice — written for DeoDap's Shopify stack and team structure)

The tool replaces ad-hoc quarterly audits with continuous monitoring. Its core philosophy: **an SEO issue that is detected the day it appears costs hours to fix; the same issue detected three months later costs rankings, revenue, and crawl budget.**

1.1 What "whole and sole" means for this tool

This is not a dashboard that mirrors Search Console. It is a complete SEO operations system covering:

- Daily technical crawl and health-check of the entire site
- Daily content quality and on-page audit (new + changed pages prioritized)
- Off-page and backlink monitoring (daily deltas, weekly deep analysis)
- AEO (Answer Engine Optimization) readiness scoring for AI search surfaces (Google AI Overviews, ChatGPT, Gemini, Perplexity, Bing Copilot)
- GEO (Generative Engine Optimization) signals: entity strength, citation-worthiness, brand authority
- Daily AI-generated-content compliance audit (built-in checks mapped to Google's spam & helpful-content policies, plus team-defined custom checks)
- A **Smart Recommendation Engine** that converts every detected issue into a prioritized, DeoDap-specific action with owner, effort, and expected impact
- Automatic task creation and team alerting so findings become work, not reports that sit unread

2. System Architecture (High-Level)

The tool is composed of six subsystems. Each can be built or bought, but they must interoperate as described.

#	Subsystem	Function
A	**Crawler & Renderer**	Daily site crawl (HTML + JavaScript-rendered), sitemap diffing, log-file ingestion (optional Phase 2)
B	**Data Connectors**	Google Search Console, GA4, PageSpeed Insights / CrUX API, Ahrefs or Semrush API, Shopify Admin API, Google Business Profile
C	**Analysis Engine**	Runs the check library (Sections 4–10) against crawl + connector data; computes deltas vs. yesterday
D	**Severity Classifier**	Assigns Critical / Medium / Low using the rules matrix (Section 3), weighted by page value (traffic, revenue, indexation)
E	**Smart Recommendation Engine**	Generates a customized fix plan per issue (Section 11), including Shopify-specific instructions
F	**Reporting & Workflow Layer**	Daily digest, live dashboard, alerting, auto-task creation in DeoDap Task Ops, issue lifecycle tracking

2.1 Crawl strategy (so daily audits stay fast and cheap)

- **Full crawl:** weekly (all indexable URLs, JS rendering enabled on a sample).
- **Daily smart crawl:** homepage + all category/collection pages + top 500 products by revenue/traffic + every URL that changed in the last 48 hours (detected via sitemap `lastmod` + Shopify webhooks for product/collection/page updates) + every URL that had an issue yesterday (re-verify).
- **Delta detection:** every check stores yesterday's result; the daily report leads with *what changed*, not the full inventory. This is what keeps the tool readable and prevents alert fatigue.

3. Severity Classification Framework

Every issue the tool raises carries one of three severities. Severity is **not** based on the check type alone — it is check type × page value.

3.1 Page value tiers (computed nightly)

- **Tier 1 (Money pages):** Homepage, top 20 collections, top 200 products by last-90-day revenue or organic sessions.
- **Tier 2 (Working pages):** All other indexable collections, products with any organic impressions, blog posts with clicks.
- **Tier 3 (Long tail):** Everything else indexable.

3.2 Severity rules

Severity	Definition	Examples	SLA
🔴 **CRITICAL**	Actively losing rankings/revenue or blocking indexation on Tier 1–2 pages; sitewide technical failures	Homepage noindexed; robots.txt blocking /collections/; Tier 1 page returning 404/5xx; sitewide canonical error; SSL failure; Core Web Vitals "Poor" on Tier 1; manual action or toxic-link spike; hacked-content signals; conversion-path page deindexed	Same day
🟠 **MEDIUM**	Degrading performance or wasted opportunity; not an emergency but compounds	Missing/duplicate title tags on Tier 2; thin content on ranking collections; redirect chains; missing product schema; images >200KB on Tier 1; internal links to 404s; declining CTR on ranking queries; new competitor outranking on a money keyword	7 days
🟡 **LOW**	Hygiene and polish; batch-fix monthly	Missing ALT text on Tier 3; H-tag order issues on low-traffic pages; long URLs; minor schema warnings	30-day batch

3.3 Automatic escalation rules

- A Medium issue on a page that enters Tier 1 → escalates to Critical.
- Any Medium issue unresolved past its SLA → escalates one level and re-alerts.
- Three or more related Medium issues on one template (e.g., all product pages missing `offers` schema) → grouped into one **Critical template-level issue**, because template bugs multiply.

---

4. Module 1 — Technical SEO Audit (Daily)

The check library below defines exactly what runs daily. Each check outputs: status (pass/fail/warn), affected URLs, severity, evidence (HTTP response, screenshot, or field data), and a recommendation payload for the engine in Section 11.

4.1 Crawlability & Indexability

Check	What it detects	Default severity
Robots.txt monitor	Any change vs. yesterday's snapshot; accidental `Disallow` of /collections/, /products/, /blogs/; blocked CSS/JS	Critical on change affecting indexable paths
Noindex sweep	New `noindex` meta or `X-Robots-Tag` on previously indexed URLs	Critical (Tier 1–2)
Index coverage delta	GSC: pages dropping from "Indexed" to "Crawled – not indexed" / "Discovered – not indexed"; spikes in excluded pages	Critical if >2% of indexed pages drop in 24h
Sitemap integrity	XML sitemap reachable, valid, <50k URLs per file, no 404/redirected/noindexed URLs inside it, `lastmod` accuracy, sitemap vs. crawl orphan diff	Medium
Orphan pages	Indexable URLs receiving no internal links (found only via sitemap/GSC)	Medium
Crawl depth	Any Tier 1–2 page deeper than 3 clicks from homepage	Medium
Crawl budget waste	Parameterized/faceted URLs (?sort_by=, ?page=, filter combinations) getting crawled and indexed; Shopify collection tag pages (/collections/x/tag) creating near-duplicates	Medium, Critical if indexed duplicates >500

4.2 Response Codes, Redirects & Links

Check	What it detects	Default severity

4xx sweep	New 404/410s, especially on URLs with backlinks or internal links; soft 404s; **429 (Too Many Requests)** responses — including 429s served to Googlebot/Bingbot by rate-limiting or bot-protection apps, which throttle crawling and can deindex pages	Critical if Tier 1, has backlinks, or 429s hit search-engine crawlers; else Medium
5xx & timeout monitor	Server errors, response time >3s at server level	Critical
Redirect audit	302s that should be 301, redirect chains (>1 hop), redirect loops, redirects to 404	Medium; Critical for chains on Tier 1
Broken internal links	Every internal `<a href>` resolving to non-200	Medium
Broken outbound links	External links to dead pages (trust/UX signal)	Low
Discontinued-product handling	Shopify products set to draft/deleted leaving live 404s instead of 301 to parent collection	Medium (auto-suggests redirect target)

4.3 Canonicals & Duplication

Check	What it detects	Default severity
Canonical validity	Missing, self-conflicting, canonicals pointing to redirects/404s/noindexed URLs; canonical vs. og:url mismatch	Critical if template-wide
Shopify duplicate paths	`/collections/{c}/products/{p}` vs `/products/{p}` canonicalization correctness (a classic Shopify issue)	Critical if broken
Duplicate content	Near-duplicate titles/descriptions/body across products (common with variant-style listings and reseller copy); duplicate H1s	Medium

Thin content	Indexable pages <150 words of unique content (collection pages with zero description are the usual offenders)	Medium
www / protocol / trailing-slash	Only one canonical host resolving 200; others 301	Critical if split

4.4 Performance & Core Web Vitals (field + lab, daily)

Check	What it detects	Default severity
CrUX field data	LCP >2.5s, INP >200ms, CLS >0.1 at origin and per-template (home, collection, product)	Critical if "Poor" on any template; Medium if "Needs improvement"
Lab PSI runs	Daily mobile+desktop PSI on homepage, top 5 collections, top 5 products; regression >10 points vs. 7-day average	Medium (regression alert)
Render-blocking & app bloat	New render-blocking scripts — on Shopify this almost always means a newly installed app; the tool diffs the script list daily and names the app	Medium, Critical if LCP degrades >0.5s
Image weight	Images >200KB, not WebP/AVIF, missing lazy-load, missing width/height (CLS), oversized hero images	Medium (Tier 1), Low (Tier 3)
Third-party payload	Total JS/third-party bytes per template, trend line	Medium on upward trend >15%/week

4.5 Security, Mobile & Rendering

Check	What it detects	Default severity
HTTPS & certificate	Cert expiry <21 days, mixed content, HSTS	Critical
Mobile usability	Viewport, tap-target, font-size, content-wider-than-screen failures (crawler renders at 390px)	Medium

JS rendering diff	Content/links present in rendered DOM but absent in raw HTML (menus, product grids injected by apps) — flags reliance on client-side rendering	Medium; Critical if primary content/links only render client-side
Pagination	`?page=N` handling: self-canonical + indexable follow pattern; no canonical-to-page-1 mistakes; reasonable pagination depth	Medium

4.6 Structured Data (validation daily)

Check	What it detects	Default severity
Schema presence by template	Product (with offers, price, availability, aggregateRating), BreadcrumbList, Organization, WebSite+SearchAction, CollectionPage/ItemList, FAQPage, Article on blog	Medium if missing
Schema errors	GSC rich-result errors + inline validation (missing required fields, price mismatch vs. visible price, review markup without visible reviews)	Critical (errors risk rich-result loss / manual action), Medium (warnings)
Schema guideline sync (monthly)	Google updates its structured-data rules regularly — the tool monitors Google's official structured-data documentation changelog and Search Central announcements every month, diffs them against DeoDap's live markup, and flags: newly **deprecated** types/rich results (e.g., the way FAQ and HowTo rich results were restricted), newly **required** or recommended fields on types the site uses (Product, Offer, Organization, etc.), and property renames/format changes. Each change generates a Fix Card with the exact Liquid/JSON-LD update needed; where auto-update is opted in (Section 17), the tool can apply the schema change itself and request re-validation in GSC	Medium; Critical if a type in use is deprecated or a newly required field is missing
Rich result coverage delta	GSC: drop in valid rich-result items >5% day-over-day	Critical

---

5. Module 2 — Content Audit (Daily)

Runs on all pages, with new/changed pages audited same-day.

Check	What it detects	Default severity
New-page QA gate	Every newly published product/collection/blog is audited within 24h against the full on-page checklist before it accumulates bad history	Report section
Content quality score	Per-page score (0–100): uniqueness, depth vs. top-10 SERP average word count, readability, media use, freshness	Medium if Tier 1–2 scores <50
Search-intent mismatch	Page ranking for queries whose SERP is dominated by a different page type (e.g., a product page ranking for an informational query that needs a guide)	Medium + content suggestion
Content decay	Pages with ≥20% organic-click decline over 28 days vs. prior 28 (GSC) — the single highest-ROI content signal	Medium, Critical for Tier 1
Freshness	Tier 1 collections/blogs not updated in 180 days	Low→Medium
Cannibalization	Two+ URLs alternating rankings for the same query cluster (GSC query-URL analysis)	Medium + consolidation suggestion
AI-content risk	Pages that are pure boilerplate/spun text with no experience signals (E-E-A-T risk under helpful-content systems)	Medium
Plagiarism/scraper check	DeoDap descriptions duplicated from supplier feeds found verbatim on competitor sites — flags where DeoDap is not the canonical source	Medium

---

6. Module 3 — On-Page SEO Audit (Daily)

6.1 Metadata & structure

Check	What it detects	Default severity
Title tags	Missing, duplicate, >60 chars (truncation), <30 chars (wasted), missing primary keyword, missing brand pattern, template artifacts ("Untitled", raw Liquid variables)	Medium; Critical if template-wide
Meta descriptions	Missing, duplicate, >160/<70 chars, no CTA/USP (No MOQ, wholesale price, COD, fast shipping are DeoDap's CTR levers)	Medium
H1	Missing, multiple, duplicate across pages, H1 ≠ topic of title	Medium
Heading hierarchy	Skipped levels, headings used for styling, zero H2s on long pages	Low
Breadcrumbs	Visible breadcrumb + BreadcrumbList schema on every product/collection; matches actual hierarchy	Medium
Image SEO	Missing/empty/keyword-stuffed ALT; filenames like `IMG_1234.jpg` on Tier 1; missing product ALT pattern (`{product} – {key attribute} – DeoDap`)	Medium (Tier 1), Low
Open Graph/Twitter	Missing og:title/og:image (affects share CTR and some AI surfaces)	Low

6.2 Template-level audits (run daily on samples, weekly full)

- **Homepage:** one clear H1, primary keyword coverage ("wholesale shopping India", "dropshipping products India" cluster), above-fold value proposition, links to all Tier 1 collections, Organization + WebSite schema, freshness block (new arrivals), internal-link count sanity (not 500+ links diluting equity).
- **Collection pages:** unique 200–400 word description (top + expandable bottom copy), H1 = collection keyword, filtered/sorted URLs canonicalized, subcollection interlinking, FAQ block, ItemList schema, first product row server-rendered.
- **Product pages:** unique description (not supplier boilerplate), specification table, wholesale/bulk pricing clarity, Product schema completeness, reviews visible + marked up, related-products and "frequently bought together" internal links, Q&A section, shipping/return info (trust for E-E-A-T), video where available.

6.3 Keyword targeting & CTR

Check	What it detects	Default severity
Keyword map enforcement	Every Tier 1–2 page has one assigned primary keyword; tool verifies presence in title/H1/URL/first 100 words and flags drift	Medium
Striking-distance queries	Queries ranking positions 5–20 with meaningful impressions — the daily quick-win list	Opportunity (daily section)
Low-CTR alerts	Queries ranking top 5 with CTR below position benchmark → rewrite title/description suggestion generated automatically	Medium
SERP feature loss	Lost featured snippet / sitelinks / rich results vs. yesterday	Medium; Critical for Tier 1 keyword

---

7. Module 4 — Off-Page SEO Audit (Daily deltas + Weekly deep-dive)

7.1 Daily

Check	What it detects	Default severity
New/lost backlinks	Daily diff via Ahrefs/Semrush API; lost links from DR>40 domains flagged for reclamation	Medium (lost quality link)
Toxic-link spike	Sudden influx of spammy referring domains (link-farm patterns, foreign-language spam, exact-match commercial anchors) — negative SEO early warning	Critical if >50 toxic domains/week
Anchor-text distribution drift	Over-optimization risk: exact-match commercial anchors exceeding ~15% of new links	Medium
Brand-mention monitor	New unlinked mentions of "DeoDap" across web/news → outreach queue for link reclamation	Opportunity

Referring-domain trend	7/30-day trend of referring domains vs. top 3 competitors	Dashboard metric

7.2 Weekly deep-dive (auto-generated report)

- **Competitor backlink gap:** domains linking to ≥2 of the top competitors (e.g., other Indian wholesale/dropshipping marketplaces) but not to DeoDap, sorted by DR × relevance → prioritized outreach list with suggested pitch angle per domain.
- **Digital PR opportunity scan:** trending queries in DeoDap's niches (home, kitchen, toys, gadgets, festival/seasonal buying in India) where data-driven content could earn coverage; festival calendar (Diwali, Rakhi, Holi, wedding season) surfaced 60 days ahead.
- **Local citations & GBP:** NAP consistency across directories, Google Business Profile health, review velocity.
- **Disavow candidate list:** maintained continuously, human-approved before any disavow submission.

---

8. Module 5 — AEO (Answer Engine Optimization) Audit

Scores how retrievable and quotable DeoDap's content is for Google AI Overviews, ChatGPT, Gemini, Perplexity, and Bing Copilot.

Check	What it detects	Default severity
Answer-block coverage	Tier 1–2 pages lacking a direct 40–60 word answer under a question-formatted H2 for their primary query	Medium
FAQ coverage & markup	Collections/products missing FAQ blocks; FAQ present but no FAQPage schema; answers too long/vague for extraction	Medium
PAA gap analysis	"People Also Ask" questions for target keywords not answered anywhere on the site → content brief auto-generated	Opportunity
Featured-snippet targets	Queries where DeoDap ranks 2–10 and a snippet exists → paragraph/list/table formatting suggestion per query	Opportunity

Extractability score	Per page: presence of definition sentences, comparison tables, numbered steps, spec tables — formats AI engines quote	Metric
Entity clarity	Organization schema completeness (sameAs → social profiles, logo, founder, address), consistent brand description across site/profiles, Wikipedia/Wikidata presence gap	Medium
AI-crawler access	robots.txt / firewall not blocking GPTBot, Google-Extended, PerplexityBot, CCBot, Bingbot (deliberate policy decision surfaced, not silently assumed)	Critical if unintentionally blocked
AI-visibility sampling	Weekly: run a fixed panel of ~50 buyer-intent prompts ("best wholesale supplier for kitchen products India", "dropshipping sites with no MOQ") against major AI engines via API; log whether DeoDap is mentioned/cited and vs. competitors	Trend metric + Medium on losses

---

9. Module 6 — GEO (Generative Engine Optimization) Audit

Check	What it detects	Default severity
E-E-A-T surface audit	About page depth, author bios on blog (real people, credentials), visible policies (shipping/returns/contact/phone), trust badges, review authenticity	Medium
Citation-worthiness	Does the site publish anything an AI would cite? Original stats, price benchmarks, buying guides with unique data ("Wholesale price index: 500 kitchen products") — gap flagged with content brief	Opportunity
Topic-cluster integrity	Pillar → cluster internal-link graph per category; orphan cluster pages; missing pillars for high-volume topics	Medium

Semantic coverage	Per money page: entity/term coverage vs. top-ranking pages (TF-IDF/embedding comparison); missing subtopics listed	Medium
Freshness signals	Visible "last updated" dates, dateModified schema, stale statistics detection	Low→Medium
Brand-authority signals	Consistency of brand facts (founding, location, USPs) across site, GBP, LinkedIn, marketplaces; conflicting facts confuse knowledge graphs	Medium
Content structure for retrieval	Chunk-friendly formatting: descriptive H2/H3 every ~150–300 words, self-contained sections, summary boxes on long guides	Low

---

10. Module 7 — AI-Generated Content Compliance Audit (Daily)

DeoDap will inevitably use AI to draft product descriptions, collection copy, and blogs at scale. That is fine — **Google does not penalize AI-generated content as such; it penalizes content created primarily to manipulate rankings rather than help people** (its Spam Policies and Helpful Content guidance). This module keeps AI-assisted publishing on the safe side of those policies, and lets the team define its own custom checks on top.

> **Note on terminology:** these are Google's published *policies and guidelines* (Search Essentials, Spam Policies, Merchant/Product data requirements), not laws — but the tool treats them as hard rules because violations carry the same practical consequence: ranking loss or manual actions.

10.1 Built-in compliance checks (mapped to Google policy)

#	Check	What it detects	Google policy it protects against	Default severity
1	**Scaled content abuse detector**	Bulk-published pages (many URLs/day) sharing near-identical AI phrasing, structure, or "fill-in-the-blank" patterns with only the product/keyword swapped	Spam policy: *scaled content abuse* — mass-producing unoriginal pages to game rankings	🔴 Critical if >30 near-identical pages published in 7 days

2	**Unedited AI boilerplate scan**	Tell-tale unreviewed AI output: "As an AI language model…", "In conclusion, …" stacks, generic filler ("In today's fast-paced world"), placeholder text, repeated sentence rhythms, zero product-specific facts	Helpful content guidance: content must show effort, originality, and value-add	🟠 Medium; Critical on Tier 1
3	**Factual-accuracy / hallucination check**	AI-written claims contradicting structured product data (wrong material, size, wattage, count, "waterproof" not in specs), invented certifications or awards, fabricated statistics without a source	Misleading content / misrepresentation policies; Merchant Center *misrepresentation* rules for product data	🔴 Critical (product claims), 🟠 Medium (blog claims)
4	**People-first value test**	Per-page LLM evaluation against Google's own helpful-content questions: original information? substantial value vs. other results in the SERP? would a reader feel satisfied? summary-of-other-pages-only content flagged	Helpful content self-assessment; "search-engine-first" content signals	🟠 Medium
5	**E-E-A-T / experience-signal absence**	AI content with no first-hand experience markers where they matter — no real usage notes, photos, tester attribution on reviews/buying guides; anonymous authorship on advice content	E-E-A-T in Search Quality Rater Guidelines; product-reviews guidance requiring evidence of firsthand testing	🟠 Medium
6	**Fake review & testimonial markup**	AI-generated or templated reviews, review schema without genuine user reviews behind it, incentivized-review patterns	Structured data spam policy; review-snippet guidelines	🔴 Critical

7	**YMYL caution gate**	AI-drafted claims touching health/safety (e.g., baby products, kitchen appliances, electrical goods — "BPA-free", "child-safe", "shockproof") without a verified source in product data	Higher E-E-A-T bar for YMYL-adjacent claims	🔴 Critical — blocks publish in the QA gate, requires human sign-off
8	**Doorway-page pattern**	AI-generated near-duplicate location/keyword landing pages funnelling to the same destination	Spam policy: *doorway pages*	🔴 Critical
9	**Keyword-stuffing & unnatural language**	Keyword density abuse, unnatural exact-match repetition typical of over-prompted AI copy	Spam policy: *keyword stuffing*	🟠 Medium
10	**Cross-site duplication**	AI content identical to supplier feeds or other marketplaces (DeoDap not the original source)	Copied/unoriginal content signals	🟠 Medium
11	**Disclosure & authorship hygiene**	Blog/advice content missing author attribution; where AI assistance is material to trust (e.g., "tested by our team" claims that are AI-written), flags the mismatch	Google's guidance: accurate authorship and honest presentation ("who, how, and why" content was produced)	🟡 Low → Medium
12	**Outdated-model artifacts**	Stale AI references ("as of 2023"), broken formatting (markdown asterisks rendered literally), prompt-leak fragments in published copy	Quality/effort signals	🟡 Low

Every flagged page gets a Fix Card with the exact offending passages highlighted, a rewritten human-quality draft suggestion, and — where check #7 fires — a hard hold in the new-page QA gate (Section 5) until a human approves.

10.2 Custom AI-content check builder (team-defined rules)

The team can add its own checks without code, via a rule builder in the dashboard. Each custom check is defined by:

Field	Options
Detection method	(a) Pattern/regex match, (b) banned/required phrase lists, (c) threshold rule (word count, keyword density, duplication %, AI-likelihood score), (d) **LLM-judged rule** — write the check as a plain-language instruction (e.g., *"Flag any product description that promises delivery timelines, since ops hasn't approved delivery promises in copy"*) and the tool's LLM evaluates each page against it
Scope	Templates (products / collections / blogs), specific collections, page tiers, only newly published, or full site
Severity & routing	Critical/Medium/Low + which team the Fix Card defaults to (SEO / Content / Development)
Action	Flag only · Flag + draft rewrite · Block in publish QA gate (new pages only)
Schedule	Daily, on-publish, or weekly

Example custom checks DeoDap might add on day one: "flag copy claiming lowest price in India", "flag any description missing the No-MOQ mention on wholesale collections", "flag Hindi/Hinglish AI translations that read machine-translated", "flag festival-offer copy still live after the festival date".

Custom checks run in the same pipeline as built-ins: same severities, same Fix Cards, same daily digest section (**"🤖 AI Content Compliance"**), same verification loop. A test mode lets the team dry-run a new rule against the last 30 days of pages before enabling it, so noisy rules never reach the digest.

---

11. The Smart Recommendation Engine (the heart of the tool)

Every failed check produces a **Fix Card** — never a bare error. Generation logic:

1. **Context assembly:** issue type + affected URLs + page tier + template + historical data (has this recurred?) + platform (Shopify theme/app implicated).
2. **Root-cause inference:** e.g., 40 products went 404 today + Shopify webhook shows they were set to draft → root cause is catalog cleanup without redirects, not a server issue.

3. **Fix selection:** from a maintained playbook of DeoDap-specific remediation templates (Shopify admin steps, Liquid template edits, app settings, GSC actions), customized with the actual URLs/values.
4. **Smart prioritization:** Impact (traffic/revenue at risk) × Confidence × inverse Effort = priority score; ties broken by page tier.

11.1 Fix Card format (what the team sees for every issue)

> 🔴 **CRITICAL — Product schema price mismatch on 312 product pages What's wrong:** JSON-LD `offers.price` shows pre-discount price while the visible price is discounted. Google flags this as misleading markup; rich results (price/rating in SERP) are at risk of removal. **Why it matters:** Product rich results drive ~15–30% higher CTR; 118 of the affected pages are Tier 1–2 with combined 42k monthly impressions. **Evidence:** [3 example URLs + extracted JSON-LD snippet vs. rendered price screenshot] **Root cause (inferred):** Theme's `product-schema.liquid` reads `product.price` instead of `product.selected_or_first_available_variant.price` after the discount app update on 26 Jul. **Exact fix:** Step-by-step Liquid edit (code snippet provided) OR rollback of app setting X; then request re-validation in GSC → Enhancements → Product snippets. **Owner suggestion:** Dev team (Shopify theme access). **Effort:** ~2 hours. **Expected impact:** High. **Verify by:** tool auto-re-checks affected URLs next crawl; card closes only when 0 pages fail.
>
> **Allocate this fix:** [**Fix with 1into2 SEO Team**] [**Fix with 1into2 Content Team**] [**Fix with 1into2 Development Team**]

11.1a One-tap allocation buttons (1into2 teams)

Every Fix Card — in the daily digest email/WhatsApp, the dashboard, and the weekly rollups — carries the three allocation buttons above. Behavior:

- **Pre-highlighted suggestion:** the engine pre-highlights the button matching its inferred owner (theme/Liquid/app/server issues → Development; copy, metadata, FAQs, briefs → Content; strategy, schema decisions, redirects, links, keyword work → SEO). One tap confirms; tapping a different button overrides.
- **Full allocation trail:** every tap records *who allocated → which team → when* ("Allocated by Ritesh → 1into2 Development Team, 30 Jul, 9:12 AM"). This appears on the card, in the issues board, and in the audit log — so there is never ambiguity about who assigned what to whom.
- **Task creation on tap:** the tap creates the task in DeoDap Task Ops (Section 12.4) with the Fix Card as description, the chosen 1into2 team as assignee group, priority mapped from severity, and SLA deadline attached. Re-allocation moves the task and notifies both teams.
- **Digest accountability section:** the daily digest includes an **"Allocation status"** line — issues allocated yesterday (by whom, to which team), issues still unallocated past 24h (auto-escalated to the SEO lead), and per-team open-load counts (SEO / Content / Development) so no team silently piles up.
- **Bulk allocation:** template-level grouped issues (Section 3.3) allocate all child pages with one tap.

11.2 Suggestion intelligence rules

- Recommendations reference **DeoDap's actual stack** (Shopify admin paths, the specific theme file, the specific app) — never "consult your developer."
- Where a fix is content work, the engine outputs a **ready-to-edit draft**: rewritten title/meta options (3 variants scored for CTR), collection description outline with target entities, FAQ questions with drafted answers.
- Recurring issues trigger a **process recommendation** ("4th time products were deleted without redirects — add a redirect step to the catalog SOP"), and the tool can file that SOP suggestion to the ops team.
- Conflicting fixes are deduplicated: one template-level fix supersedes 300 page-level cards.

---

12. Reporting, Alerting & Team Workflow

12.1 Daily digest (auto-delivered 8:00 AM IST — email/WhatsApp/Slack)

1. **SEO Health Score** (0–100, weighted composite) + 7-day trend.
2. 🔴 **New Criticals** (each with one-line summary + Fix Card link) — target: zero.
3. 🟠 **New Mediums** grouped by module.
4. 🤖 **AI Content Compliance** — new flags from Module 7, with offending passages and rewrite drafts.
5. ✅ **Verified fixed since yesterday** (closes the loop, shows progress).
6. 📈 **Daily opportunities:** top 5 striking-distance keywords, top 3 CTR rewrites, 1 content brief.
7. **Allocation status:** who allocated what to which 1into2 team yesterday; unallocated issues past 24h; open load per team.
8. **Watchlist:** items approaching SLA breach.

Every issue line in the digest carries the three one-tap buttons: **[Fix with 1into2 SEO Team] [Fix with 1into2 Content Team] [Fix with 1into2 Development Team]** (behavior in Section 11.1a).

12.2 Real-time alerts (bypass the digest)

Sitewide 5xx, robots.txt change, homepage/Tier-1 noindex, SSL failure, indexed-page collapse, toxic-link spike, Core Web Vitals template turning "Poor". Delivered instantly to the dev + SEO channel.

12.3 Dashboard views

- **Overview:** health score, issue counts by severity/module, CWV per template, indexation trend, visibility trend (rankings + AI-mention panel).
- **Issues board:** filterable by severity/module/allocated team (1into2 SEO / Content / Development)/allocator/status (New → Assigned → In Progress → Fixed → Verified → Closed). Nothing closes without automated re-verification.

- **Opportunities board:** keyword gaps, content briefs, link prospects — each convertible to a task in one click.
- **Competitor view:** side-by-side visibility, CWV, backlink growth, content velocity vs. 3–5 named competitors.

12.4 DeoDap Task Ops integration (recommended)

Tapping an allocation button creates a task in the DeoDap task system with the Fix Card as description, the chosen 1into2 team (SEO / Content / Development) as assignee group, priority mapped from severity, and deadline mapped from SLA. Unallocated Criticals auto-create a task to the engine-suggested team after 24h so nothing waits on a tap. The allocation trail (allocator → team → timestamp) is written into the task activity log. Verification by the tool auto-comments on the task; the team's existing overdue/report workflows then apply to SEO work like any other work.

12.5 Weekly & monthly rollups

- **Weekly (Monday):** off-page deep-dive, AI-visibility panel results, competitor movement, SLA compliance, top 10 priorities for the week.
- **Monthly (executive, 1 page):** organic traffic/revenue vs. last month & YoY, health-score trend, issues opened/closed, ranking movement on the money-keyword set, AI-mention share vs. competitors, 3 recommended strategic actions.

---

13. Keyword & Content Opportunity Engine (continuous)

- **Keyword gap:** weekly pull of keywords where ≥2 competitors rank top 10 and DeoDap doesn't; filtered by relevance to live categories; classified informational/commercial/transactional; low-KD quick wins flagged.
- **Auto content briefs:** each approved gap generates a brief — target keyword + cluster, intent, suggested URL/type (collection vs. blog vs. buying guide), outline from SERP analysis, entities to cover, FAQ set, internal links to add.
- **Seasonal planner:** India festival & season calendar drives 60-day-ahead prompts (Diwali gifting, Rakhi, monsoon products, wedding season, back-to-school) mapped to existing collections needing refresh or new landing pages.
- **Cluster tracker:** per topic cluster: pillar status, cluster completeness %, interlinking integrity, combined cluster traffic trend.

---

14. Scoring Model

SEO Health Score (0–100) = weighted: Technical 30% · On-Page 20% · Content & AI Compliance 15% · Performance/CWV 10% · Off-Page 10% · AEO 8% · GEO 7%. Each module score = 100 − severity-weighted open issues normalized by site size, with Tier 1 issues weighted 5×. The score is designed so that **fixing Criticals moves it visibly** — it is a motivation instrument, not vanity.

15. Data Sources & Access Requirements

Source	Used for	Access needed
Site crawler (self-hosted or Screaming Frog/Sitebulb scheduled, or SaaS crawler API)	Modules 1–3, 5–6	Crawl allowance; verify crawler user-agent allowed
Google Search Console API	Indexation, queries, CTR, rich results, cannibalization, decay	Owner access
GA4 API	Revenue/traffic for page tiers	Viewer+
PageSpeed Insights + CrUX API	CWV lab & field	API key
Ahrefs **or** Semrush API	Backlinks, keywords, competitors, toxicity	Subscription with API units
Shopify Admin API + webhooks	Product/collection change detection, redirect automation, theme/app diffing	Custom app, read scopes (+ write for redirects if automation approved)
Google Business Profile API	Local signals	Manager access
AI engine APIs (OpenAI, Gemini, Perplexity)	Weekly AI-visibility panel	API keys, small budget

16. Build & Rollout Plan

Phase	Timeline	Deliverables
Phase 1 — Foundation	Weeks 1–3	Crawler + GSC/GA4/PSI connectors; Technical module (4.1–4.3, 4.6); severity classifier; daily digest v1; Critical alerting

Phase 2 — On-page & Content	Weeks 4–6	Modules 2–3 full; Fix Card engine v1 (playbook of top 40 issue types); dashboard + issues board; 1into2 allocation buttons + allocation trail + Task Ops task creation
Phase 3 — Off-page, AEO/GEO	Weeks 7–9	Backlink deltas + toxic monitor; AEO/GEO modules; Module 7 built-in AI-content compliance checks + publish QA gate; AI-visibility panel; opportunity engine + content briefs
Phase 4 — Intelligence	Weeks 10–12	Root-cause inference, template-issue grouping, CTR title-rewrite generator, custom AI-content check builder (10.2), seasonal planner, SLA/escalation automation, monthly exec report

Acceptance criteria for "done": daily digest arrives by 8 AM IST with <5% false positives on Criticals; every issue carries a complete Fix Card; re-verification closes issues automatically; a new template-level bug injected in staging is detected within one daily cycle.

---

17. Governance & Guardrails

- **No silent auto-changes to the live site.** The tool may *propose* redirects, meta rewrites, schema updates, and disavows; humans approve. (Optional Phase-4 exceptions the team can opt in to: auto-301 for deleted products to their parent collection, and auto-applying schema updates required by Google's monthly guideline changes — see the schema guideline sync check in 4.6.)
- **Threshold configuration file** (severity cutoffs, tier definitions, SLA days, alert channels) editable by the SEO lead without code changes.
- **False-positive feedback:** every card has "Not an issue" with reason; the classifier learns exclusions (e.g., intentionally noindexed pages list).
- **Audit log:** every alert, task, and verification is logged — the monthly report is generated from this log, so reporting is always evidence-backed, never manual.

Appendix A — Issue Taxonomy Summary (for build reference)

Critical class: indexation blockers, sitewide template failures, security, Tier-1 availability, schema errors risking rich-result loss, AI-content policy violations (scaled content abuse, fabricated product claims, fake reviews, doorway patterns, unverified YMYL claims), toxic-link attacks, CWV "Poor" on money templates, index-coverage collapse. **Medium class:** AI-content quality flags (boilerplate, missing experience signals, unnatural language, cross-site duplication), metadata defects, thin/duplicate/decaying content, redirect hygiene, missing

schema, image weight, internal-link breakage, cannibalization, CTR underperformance, lost quality backlinks, AEO/GEO structural gaps. **Low class:** hygiene items batched monthly — ALT text long-tail, heading order, outbound broken links, minor schema warnings, URL cosmetics.

Opportunity class (not defects): striking-distance keywords, snippet/PAA targets, content briefs, link prospects, unlinked brand mentions, seasonal landing pages.

End of specification. This document is intended to be handed to the DeoDap build team (or a vendor) as the complete functional definition of the daily SEO audit tool. Threshold values, competitor lists, and the money-keyword set should be finalized in a kickoff workshop before Phase 1 begins.
